

Sustainable Digital Architecture Framework (SDAF)

Turning sustainability evidence into defensible digital decisions

SDAF is an open, vendor-neutral framework for integrating lifecycle evidence, sustainability requirements and assurance into consequential digital decisions.

Digital architecture decisions determine hardware demand, energy consumption, infrastructure utilization, equipment lifetimes, supply-chain impacts and end-of-life outcomes.

Every assessment follows a repeatable five-phase lifecycle:

SDAF creates a traceable basis for explaining what was assessed, which evidence was used, how uncertainty was treated, why an option was selected and when the decision should be reviewed.

For decision authorities and the architecture, engineering, sustainability, procurement, operations, governance and assurance functions that support them.

Publication status: Openly published under CC BY 4.0 for implementation, evaluation and community review. Publication does not imply formal peer review, certification or institutional endorsement.
